FIELD-TEST PROPOSAL · PREPARED FOR TEQS

VR EEG Studio

VR EEG Studio records brain activity (EEG) and VR game events on one clock, so we can measure mental effort and relaxation while people use real VR experiences. We are looking for host sites in Japan for short field tests.

How it works

Runs offline on one laptop: no internet or cloud service is needed at the site.

A session · about 30–40 min per person, seated

About 8–10 people a day with one setup. Planning estimates; can be shortened for busy sites.

The two VR studies

Study	Protocol	Question
VR Vending Machine	1 min rest (eyes open) · 3 × 5 min trials · 30 s breaks	How much mental effort does the task take, and does it drop with practice?
VR Relaxation	2 min rest (eyes closed) · 2 × 5 min scenes · 1 min breaks	Does the scene help people relax compared with their own rest?

We bring

- EEG headset, VR headset and laptop
- Staff to run every session ([2] people)
- Consent forms in Japanese
- Cleaning of equipment between participants

The site provides

- A quiet space of about 3 × 3 m
- A table, two chairs and one power outlet
- A spot away from large electrical equipment
- Adult volunteers: [__] people over [__] days

Safety and privacy

Non-invasive — the headset only reads signals.

Voluntary — written consent; stop at any time.

Anonymous — participant codes, stored on our laptop, not in the cloud.

Research, not diagnosis — group trends only; no medical results.

Next steps

1. TEQS suggests 2–3 candidate sites
2. We visit, demo the system and check the space
3. Pilot days, then a summary report shared with the site
